

App to allow client to keep track of their inventory

Inventory should track each product

Inventory should track each manufacturer

App needs to be able to create edit and delete products and manufacturers **separately**

Low level and OoS items need to be displayed

Inventory page will list all products with their stock level

As a solo entrepreneur I need to be able to:

See all the items in my inventory at once

Easily identify low level products and OoS products

Know what products are from what manufacturer and be able to access their details

Inventory is the combo page that will have all details of the **products** with their name, description (wool type and size), stock level for **high**, **low** and **OoS**, buying/selling cost, and **manufacturer** name (clickable link to individual manufacturer)

Products page will just have a basic list of products and the add/remove feature

Manufacturers page will have all the details needed for contacting as well as shipping estimates. Ability to add/delete manufacturers

EXT Ideas

Have a separate inventory page that will be ordered in stock levels

Home page 'quick look' of low stock and an order more button to link to the manufacturer page (EXT)
